In every sector there is one who leads the way:
Wacom signature tablets for electronic signatures.

A clear signal: 85% market share in the pen tablet segment.

If you have opened this page, then at least one thing is clear: You are actively searching for ways of making workflows leaner and more efficient. By deciding to digitise signature capture and implement paperless workflow, you release enormous saving potential. The question remains: Which is the right technology? And which provider is really the best for an investment on this scale? These are the questions that Wacom would like to answer today. We'd like to introduce ourselves – as the global market leaders in the pen tablet segment with an 85% market share.

27 years' experience with pen tablets will pay off immediately for you.

If you invest today to save money tomorrow with signature tablets, your primary requirement is investment security – and the certainty of having made the best possible use of the financial resources. Because the return on investment is assured. Because the technology is sustainable and pioneering. Because implementation is simple and trouble-free. And because the business risk is manageable: With Wacom e-signature you are implementing 27 years of experience in pen technology – and that implies the highest level of expertise.

Unrestricted investment security also means: Freedom from maintenance.

The best pen tablets are of no use if they are not specifically designed for the extreme stresses of day-to-day use – at the check-out or counter, or on the road. Small details here mean major advantages: Material selection, processing, robustness. And above all, freedom from maintenance. For you, this means: Once your Wacom signature tablets are installed, the paperless workflow is trouble-free. Without interruption. And everyone will gladly sign up to that.

X Paperless

Please sign here

Perceptible boost to efficiency: Paperless signature capture with Wacom.

Goodbye to printing, scanning, transporting, archiving and paper clutter.

Shops, banks, telecommunication providers, authorities or health services: Signatures are needed on documents everywhere. Sales slips, transactions, contracts, powers of attorney, declarations of consent – all on paper. This is expensive. So the integration of a solution for digital signature capture quickly pays off. Reduced paper consumption, lower transport costs, less time spent searching for documents, reduced costs for printing and physical storage – all this leads to a rapid return on investment even after a few months.

Individual solutions for your digital document management system.

Wacom signature tablets are suitable for environments where there are digital workflows and stringent security requirements. These call for individual solutions: A shop's ePayment solution will need a different configuration than a hotel check-in. Wacom can manage this range – with a wide product portfolio and with experienced partners to implement your individual solution.

Secure data collection, secure data transmission.

Thanks to high resolution and impressive precision, the Wacom technology is distinctly superior to other systems for capturing handwritten signatures. Using the recorded data (X/Y position and pressure), a unique and unequivocal biometric signature profile of the signatory can be created for verification and authentication purposes – naturally with secure encryption and transmission.

Top references:
These firms work with Wacom e-signature.

IKEA Germany uses TeleCash. With Wacom signature tablets.

Thousands of vouchers daily to be printed, torn off, collected, transported to the warehouse for archiving, and laboriously searched for days or weeks later to match up with return debits – this is daily life in retail trade. Electronic signature solutions yield significant savings potential here. IKEA Germany exploits these to the full – with a payment slip management system from TeleCash GmbH & Co. KG, which is based on Wacom signature tablets and revolutionises the checkout area in all IKEA's shops.

Spain's savings banks save 30 million euros a year. With the STU-500.

Money transfers, contracts for current accounts, credit card transactions, deposit slips – the typical (savings) bank transactions require many signatures of customers and bank staff. The Spanish savings banks Confederación Española de Cajas de Ahorros (CECA) decided on Wacom's STU-500 signature tablet. With resounding success: CECA calculated a direct saving of 3 cents for every piece of paper. This led to a cost reduction of around 30 million euros per year for the overall project.

Well positioned for the future with Wacom. Swiss Sunrise AG.

Mobile phone contracts, Internet contracts, tariff changes – numerous documents in the telecommunications sector need signatures. The cost of creating, editing and checking these documents is extremely high. As the second largest Swiss mobile phone company, Sunrise AG therefore chose an e-signature solution from Wacom – as did mobilkom austria (A1 Telekom Austria). The result: Customers are dealt with more quickly, and the staff at the PoS can make better use of the time saved – for advice and sales.

X Tailor-made

Global benchmark:
Wacom pen technology.
The Wacom claim is: Anyone deciding on Wacom products should be able to be sure at any time of having the best possible, most modern and most efficient technology – because this is investment security too. The patented Wacom pen technology is the best example of this: It combines a high-precision high-speed sensor with the cordless, battery-free, pressure-sensitive pen with up to 512 pressure levels.

Extremely precise biometric profiles:
Signature capture in 3D.
Anyone who decides on an e-signature solution from the technology leader can expect a little more. Every single signature tablet from Wacom delivers on this promise. Because as well as the coordinates of the signature, the Wacom pen tablets also register the pressure profile during the writing operation. This results in a biometric profile which can hardly be surpassed and is globally unrivalled to date.

For the day-to-day endurance test:
Embedded sensor under tempered protective glass.
The useful life and robustness of a signature tablet depend on many factors. The most important factor is the sensor. In all Wacom signature tablets the sensor is embedded in the display, under tempered anti-glare protective glass. Wacom sensors are thus more robust than sensors mounted on the display, which are not protected against scratches or other forms of wear. With hundreds of day-to-day demands, this difference soon becomes obvious.

Equip yourself with leading technology to get ahead.

Brings colour to counters and check-outs.
The Wacom STU-520.

Captures signatures with the greatest precision – and shows your logo in colour.
The STU-520 sets new standards in e-signature:
With the first LCD colour display for Wacom signature tablets, it not only enables high-precision capturing of signatures with the proven pen technology in a workplace, it also offers your company a platform for striking brand presence at the same time: It displays your logo in colour. Your Wacom e-signature solution can thus be individually identified.

Natural writing feel with 512 pressure levels.
The STU-520 offers your customers the height of user convenience: It captures the signature with 512 pressure levels, displays it instantly in high resolution with “digital ink”, and at the same time ensures a natural writing feel.

Robust processing for maximum daily loads.
The STU-520 is the long-life signature tablet for heavy use:
It shows its qualities especially in stationary use at counters and check-out systems – and in spite of its very compact design it offers excellent resolution of 800 x 480 pixels in the 16:10 format.

Ideal for stationary use:
Efficient and robust. STU-500.

The Wacom model of success.
In deciding on the monochrome LCD signature tablet STU-500, you are choosing a true allround genius: Since it registers even the slightest changes in pressure, it allows unique biometric signature profiles to be created. With 512 actual pressure levels, paper-like surface and real-time visualisation on the brilliant TFT LCD display, it supplies a natural writing feel – comparable with a signature on paper.

Copes with everything, and makes signing easy.
The 5-inch screen of the STU-500 is wide enough even for long signatures. With its sensor within the display under tempered glass, it does only register movements of the pen, not of the hand or fingers. The VGA resolution of 640 x 480 pixels likewise allows the display of additional content such as transaction amounts or contractual details.

The classic for counters and check-outs.
The STU-500 was developed for day-to-day use at public counters or check-out systems. This means that it was specifically designed for capturing millions of signatures. Its reflective TFT technology means there is no need for backlighting – which makes for considerably lower energy consumption and a longer lifetime.

Ideal for mobile use:
Compact and efficient. The STU-300.

Sign here. Anywhere.

With its small compact form and robust design, the Wacom LCD signature tablet STU-300 is ideally suitable for all who have to work frequently with documents while on the move, such as insurance agents or customer support staff. Their customers can quickly and safely sign contracts, authorise payments and confirm deliveries – all without paper documents.

All inclusive: STU-300 technology.

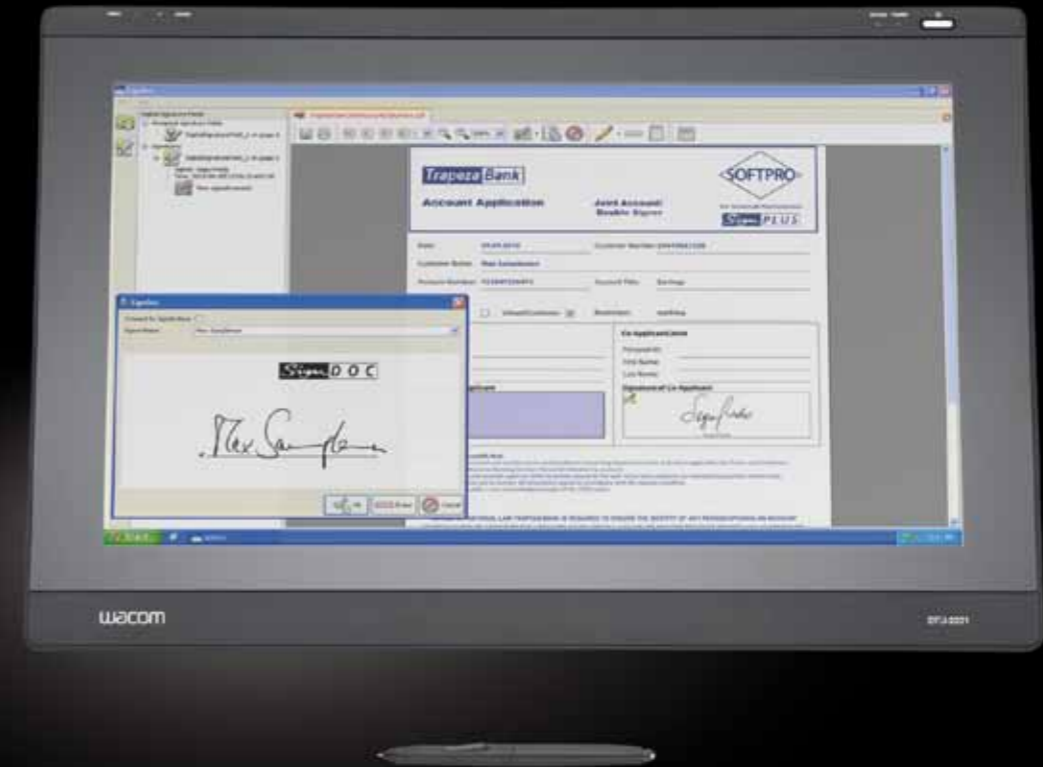

Naturally, the STU-300 also offers all the advantages of the unique Wacom pen technology: 512 actual pressure levels, a real data rate of 200 points per second and a resolution of 2,540 lpi ensure maximum precision.

Small details for the mobile edge.

The tablet was developed for all eventualities in day-to-day use, and offers a broad display surface, which is suitable even for long signatures. The pen is linked to the tablet with a tether to stop it getting lost, and for transport it can be stowed conveniently in the pen rest.

For large-format forms.
The interactive PL pen displays.

The PL 2200: With 22-inch display and full HD.

More space for extensive documents – for high-quality PoS environments, in which large-format forms are displayed and must be signed, the interactive Wacom pen displays of the PL series are the answer. The best example is the PL-2200, with a large 16:9 display, 56 cm (22 inch) diagonal and native full HD resolution, which can be used simultaneously as a presentation device and a consultation tool.

The PL-1600: The compact 16-inch HD solution.

Are you looking for a flexible, space-saving solution for capturing electronic signatures? Our tip: The PL-1600 with HD-capable widescreen display in compact format at 40.6 cm (16 inch).

The PL-720: In 4:3 format and with 17-inch display.

If you would rather invest in a “small” large-format solution, such as that used e.g. at mobilkom austria or in Metro Cash & Carry stores: The PL-720 with 43.2 cm (17 inch) LCD screen and compact 4:3 format.
